

wiki2xhtml Guidelines for developers

Checklist

All documentation needs to be updated before releasing a new version of wiki2xhtml.

- Web documentation of wiki2xhtml: All files describing how wiki2xhtml works. This also includes the following files, in any language: quickstart.txt Cheatsheet.odt
- «Internal» documents: Guidelines*.odt, resources/gui-about.html
- Translations, after running `./lang-update.sh: l10n/po/*.po`

Next thing to be updated is everything that has to do with versions.

- Web documentation: index.txt, news.txt, changelog.txt, download.txt
- Configuration files: pad.xml, granjow.net/wiki2xhtml (and, if available, others)
- Source code (Constants.java)
- Build file for the jar file: build.xml

Now the release has to be created.

- Create the language files: `./create-lang.sh`
- Create the jar file; make sure to use Java 5: `javac program/UserInterface.java && ant`
- Build the packed files: `./release.sh versionNumber`

The previous step may be repeated if the file sizes in download.txt have to be adjusted. Now the files have to be uploaded.

- SVN Repository: Tag the new version
- [Upload wiki2xhtml](#) to sf.net
- Upload: pad.xml, granjow.net/wiki2xhtml

Last step: Notify users

- Mailing list
- sf.net
- freshmeat.net
